Genetic Engineering Technologies

Transgenesis (Tg)

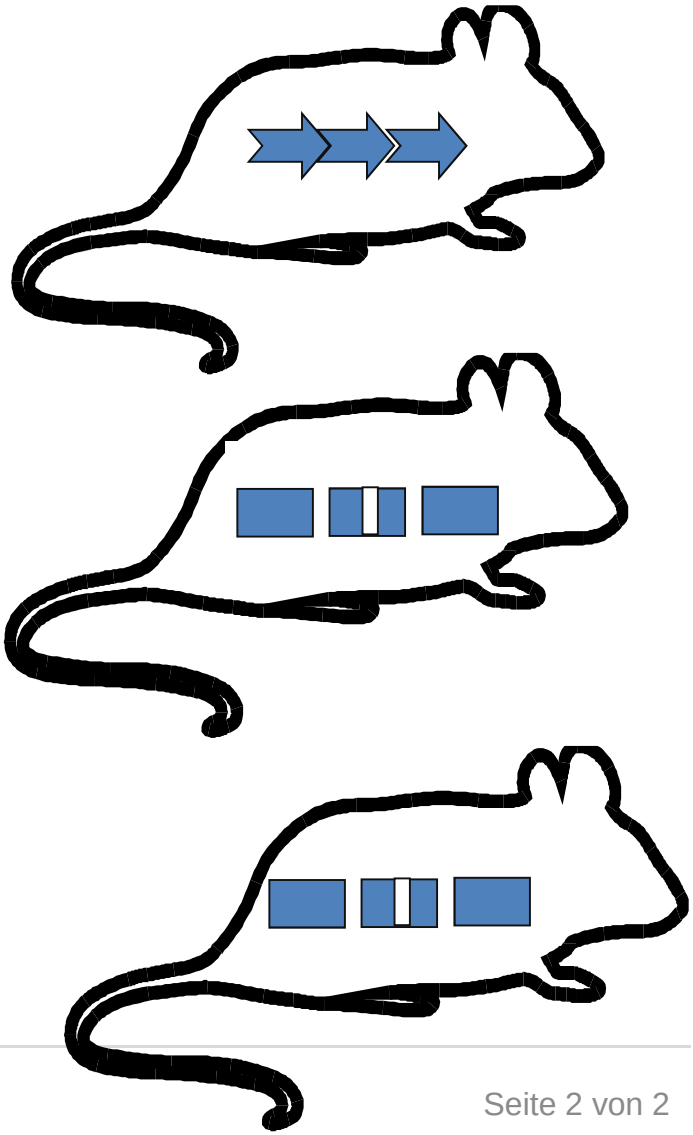
- Adding new genetic material

Homologous Recombination and Target Mutation (Tm)

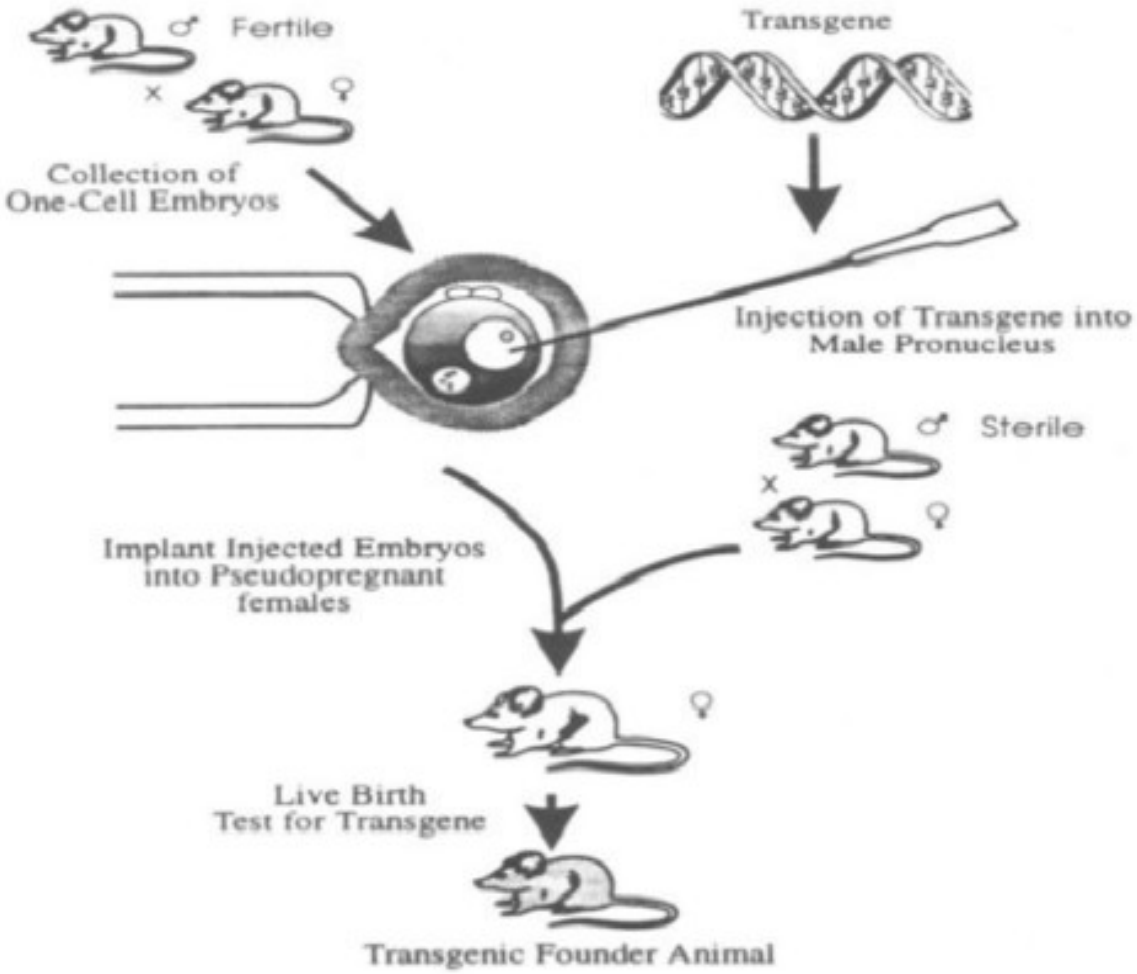
-Targeting a specific gene using ES cells

Endonuclease Mediated Mutation (Em)

- Targeting a specific gene using Crisp/Cas



TRANSGENIC MOUSE (Tg)



Unpredictable features linked to Transgenesis

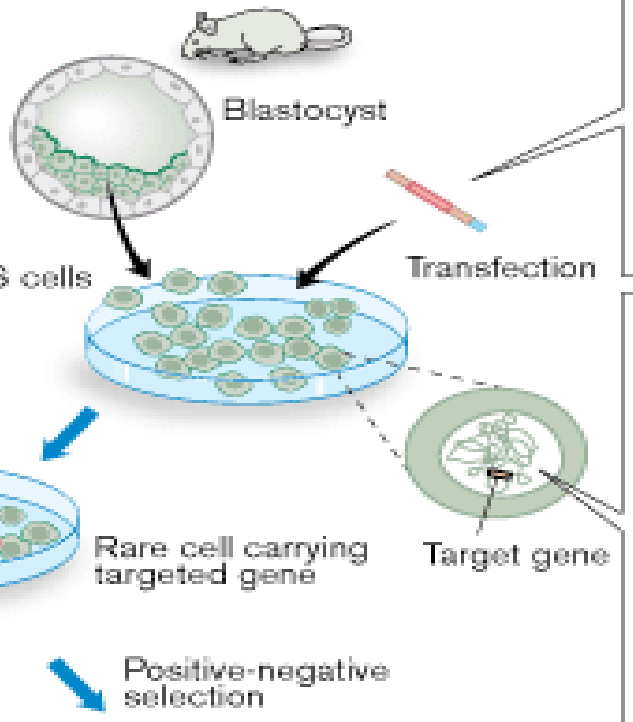
- Disruption (functional KO) of endogenous gene
- Misregulation of endogenous gene (expression profile)
- Misregulation of transgene (expression profile)
- Unstability of insertion site in successive generations
- Variegation of transgene expression (uneven profile within a tissue)
- Silencing of transgene expression in successive generations
- Mosaicism and reduced transmission to F1
- Multiple integrations and segregation > F1
- Embryolethality

- Immunity defects (consequences on housing hygiene and HM)
- Behavioral alterations (could be subtle defects)
- Reproductive defects
- Other defects

General strategy for gene targeting in mice

Step 1 Gene targeting in ES cells

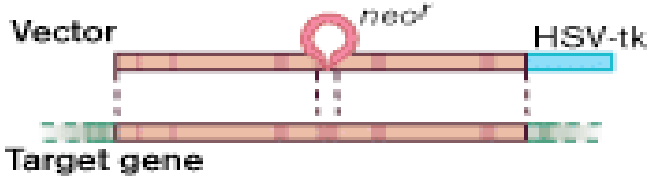
1. ES cell culture
Embryonic stem (ES) cells are cultivated from mouse pre-implantation embryos (blastocysts).

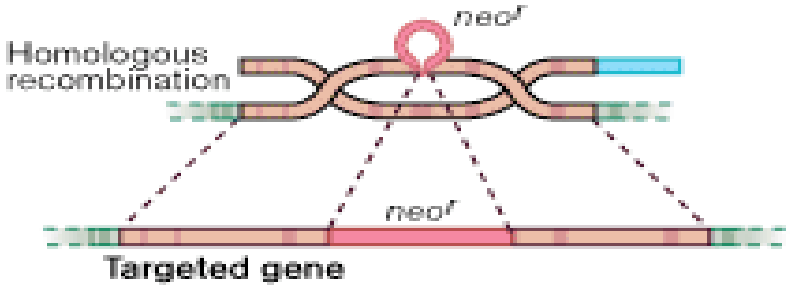


4. Proliferation of targeted ES cell
Selection for presence of *neo*^{r} and absence of HSV-tk enriches targeted ES cells.

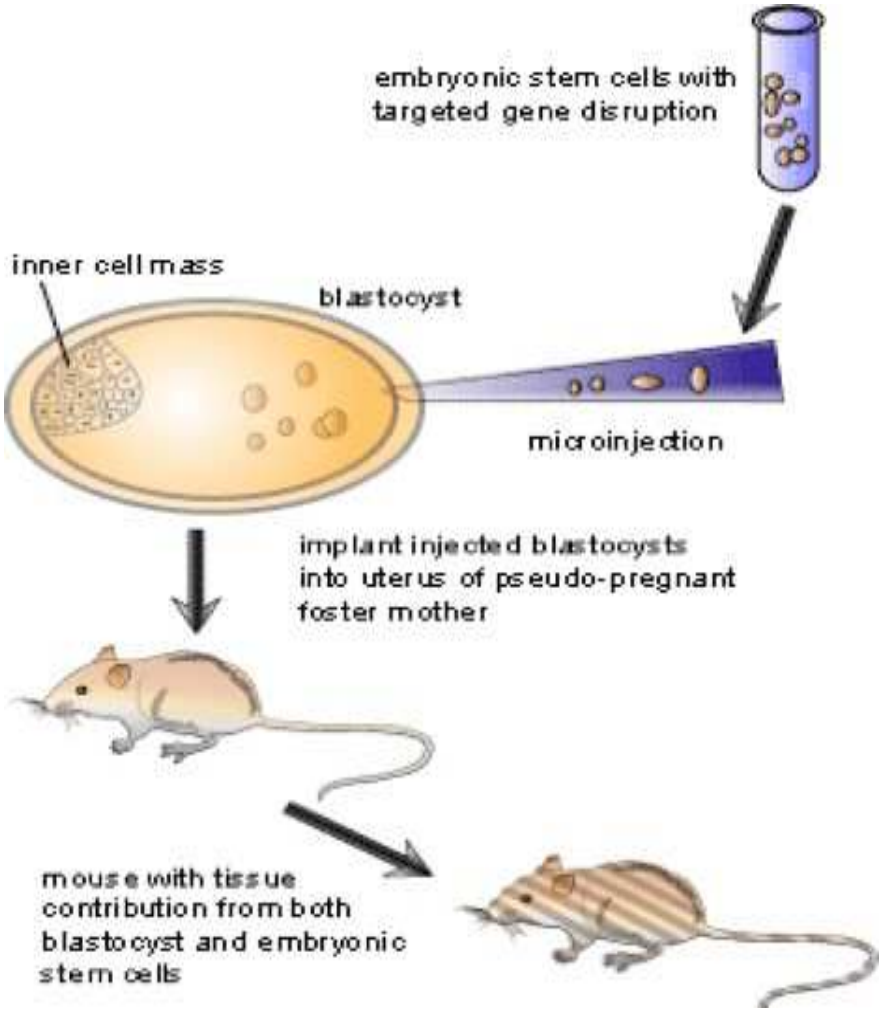
2. Construction of targeting vector
The vector contains pieces of DNA that are homologous to the target gene, as well as inserted DNA which changes the target gene and allows for positive-negative selection

3. ES cell transfection
The cellular machinery for homologous recombination allows the targeting vector enables the target vector to find and recombine with the target gene.





TARGET MUTATION (KNOCK OUT and KNOCK IN)

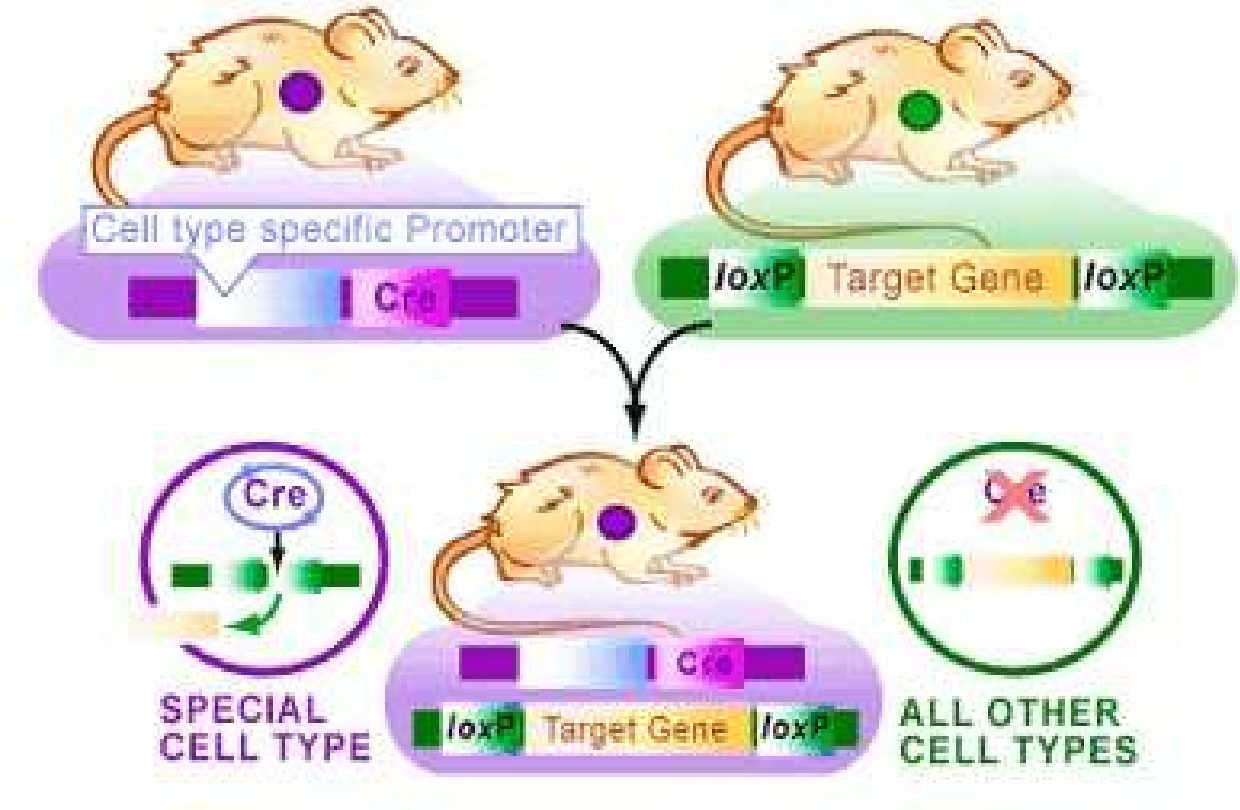


CONDITIONAL MUTAGENESIS

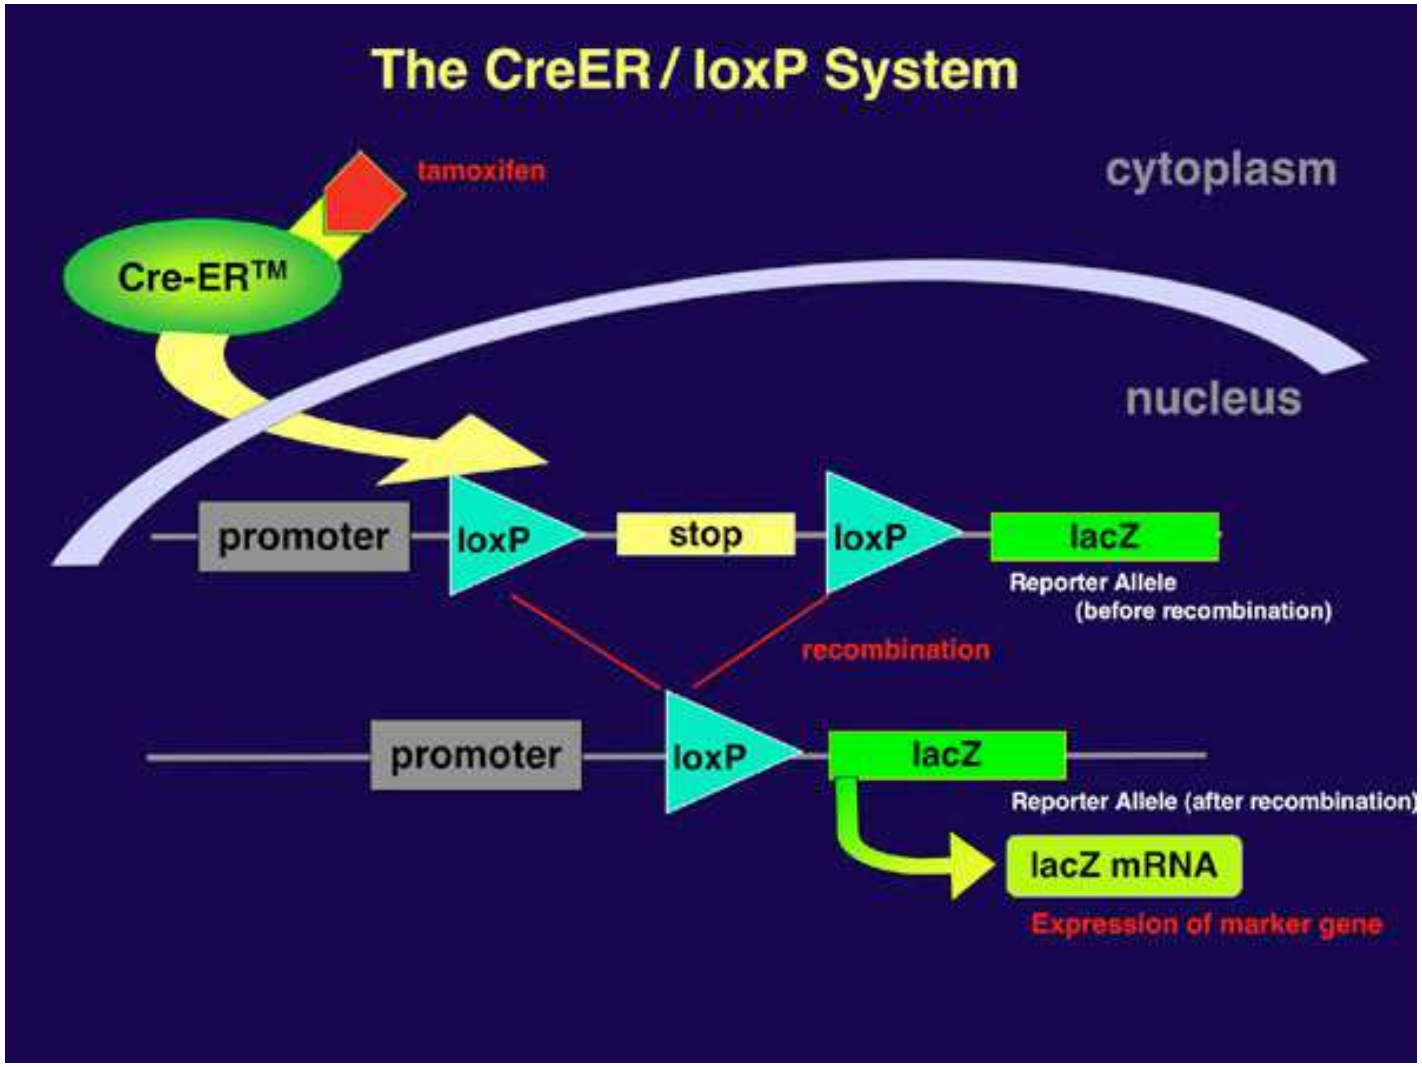
Multiple strategies are being developed to topologically and / or temporally restrict mutations of genes in transgenic mice, knock out, knock in and knock down models from year 2000.

They rely on the use of site-specific recombinases, of heterologous origin, that promote deletion of targeted genomic DNA fragments, thereby inactivating the gene of interest, and variations of these systems. The most popular is the Cre/lox system. The Cre recombinase acts on your element when it is flanked by loxP sites. The Flp recombinase acts on your element when it is flanked by FRT sites.

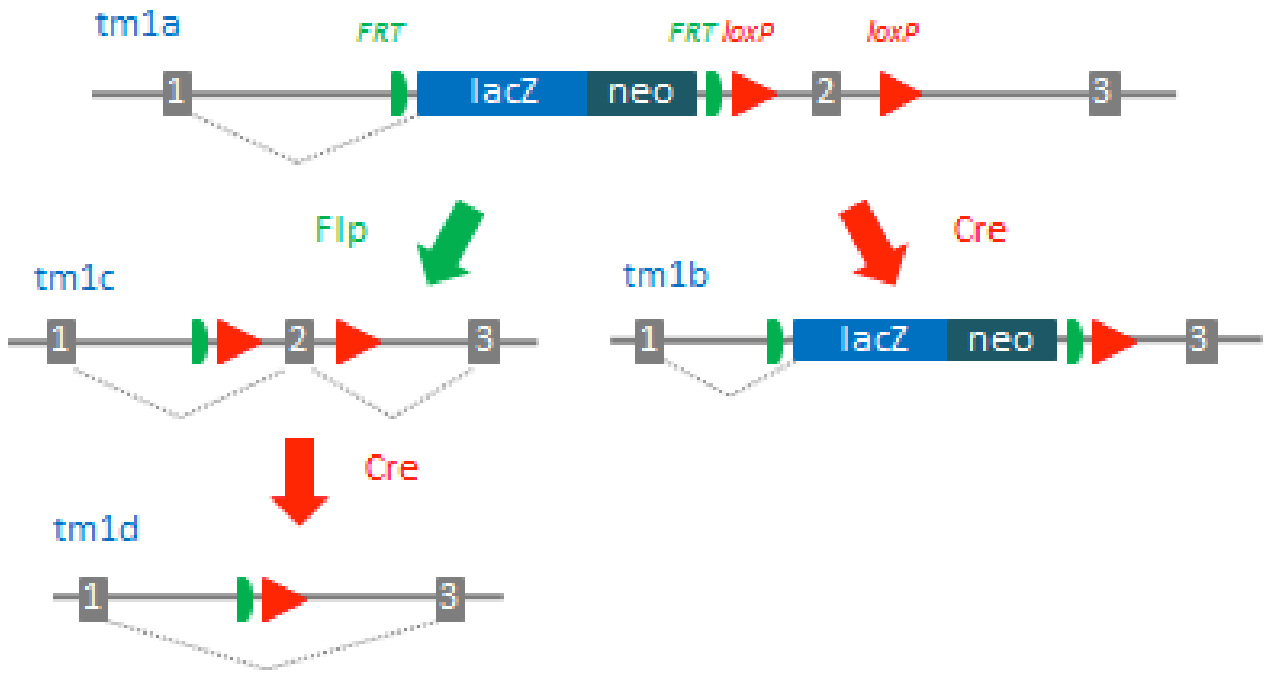
CONDITIONAL KNOCK OUT



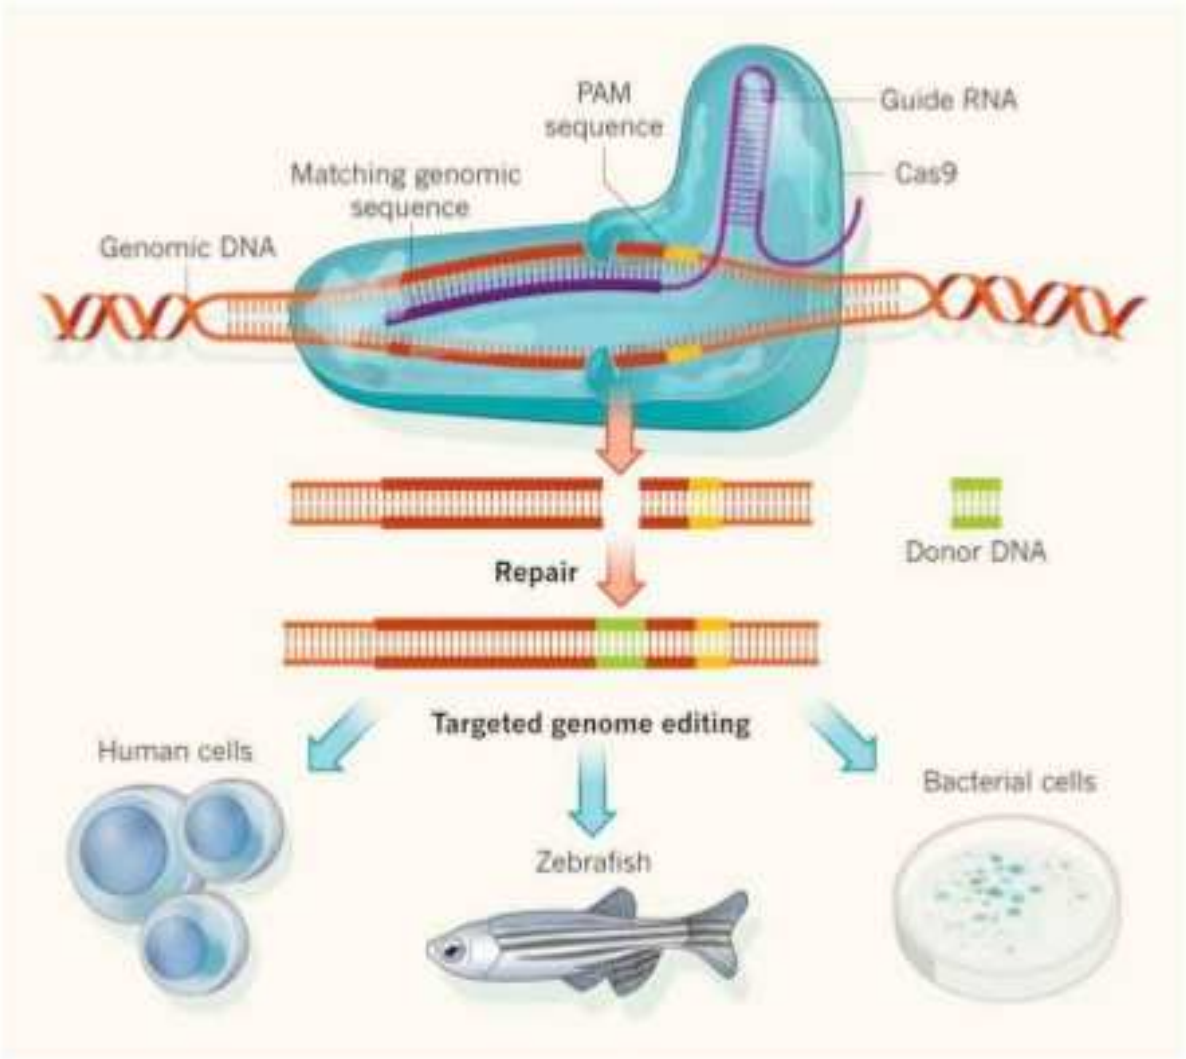
TAMOXIFEN INDUCIBLE CRE EXPRESSION



Knockout-first allele: Promoterless selection cassette



Crispr Cas-9 editing tool



1909 C.C. Little begins developing inbred strains
defined genetic background to study
complex trait, tumor transplant acceptance
genetic component?
map tumor transplantation genes?

- Genetically identical
- DBA- first inbred strain, now at > ~F250 Other common strains: AKR/J, BALB/cJ, C57BL/6J
- Coisogenic strains- spontaneous mutations give rise to strains that are genetically identical except at the mutated locus.
- Congenic strains- are artificially derived by breeding and include extraneous genetic material from the donor parent.

Inbred Strains

Advantages

- Genetic and Phenotypic uniformity
- Well Characterized
- Most of standard inbred strains >200 generations

Disadvantages

- Not as robust (smaller, lower reproductive performance, shorter lifespan)
- Strain-specific characteristics
- Expensive

Uses

- Widely used in all types of research (immunology, cardiovascular biology, neurobiology etc.)
- Models for human disease
- Background for mice with targeted mutations

Genetically Modified Mice can be compared experimentally with Wild-Type inbred strain, as control, if the line is on a pure genetic background

The line has been created from C57BL/6N ES Cells and maintained on B6N background

The line has been created from another ES line (e.g. 129 ES Cells) then Backcrossed on B6N background for more than 10 generations

It is important to maintain a record of each crossing of your line to know if you are working on a pure or a mixed background

National Competent Authorities for the implementation of Directive 2010/63/EU on the protection of animals used for scientific purposes

- CORRIGENDUM of 24 January 2013 -

Working document on genetically altered animals

Brussels, 23-24 January 2013

The Commission established two Expert Working Groups (EWG) (to develop common format for statistical reporting and for the assessment of severity of procedures) to facilitate the implementation of Directive 2010/63/EU on the protection of animals used for scientific purposes. All Members States and main stakeholder organisations were invited to nominate experts to participate in the work.

The EWG for the statistical reporting met several times in 2011. During their work it became apparent that some further understanding was needed as to how genetically altered animals are to be considered. To seek some clarity to some of the questions, the first meeting of the Severity Assessment EWG focused on the genetically altered animals in its meeting in December 2011.

The consensus reached for the understanding of how genetically altered animals are authorised and covered by the statistics is detailed in this document. The document is the result of the work of the different EWGs, discussions with the Member States as well as legal input from the Commission. It was endorsed by the National Competent Authorities for the implementation of Directive 2010/63/EU at their meeting of 22 - 23 March 2012, followed by the endorsement of the GA welfare assessment scheme (incorporated in the Annex) at their meeting of 11-12 July 2012. A corrigendum to the Annex was endorsed on 24 January 2013.

Key Elements of a GA Rodent Welfare Assessment Scheme

Include animals of representative age groups

- soon after birth, around weaning and again following sexual maturity*)
- a minimum of 7 males and 7 females sampled from more than one litter
- data from a minimum of two breeding cycles (from F2 onwards)
- comparisons made wherever possible with similar non GA animals.

*) and at additional time points as considered appropriate by a prospective review of the potential impact of the gene alteration e.g. where there is an age dependent onset of disease

CRITERIA	WHAT TO LOOK FOR
Overall Appearance	Is the animal morphologically 'normal'? Are there any malformations or any other indicators that the phenotype has been affected? For example skeletal deformity or hydrocephalus.
Size, conformation and growth	Are there any deviations from expected size or growth curve?
Coat condition	Is there any piloerection, areas of fur loss, loss of whiskers, barbering? Is the skin / fur in good condition?
Behaviour – **Posture, gait, activity and interactions with the environment**	Do they exhibit the full repertoire of behaviours appropriate for the strain/species, including social interactions, grooming, walking, running, digging, climbing? Are these normal? Is the animal hunched or reluctant to move? Is movement impaired or is there any difficulty with orientation? Any signs of rigidity or tremors? Any abnormal activity levels? Prolonged inactivity could indicate chronic stress or depression (anhedonia) and/or sickness/pain, particularly if linked with a hunched posture and/or rough or unkempt coat. Unusual activity, such as hyperactivity, could indicate stereotypy or other behavioural abnormality.
Clinical signs	For example - nasal or ocular discharge, swollen or closed eyes; increased respiratory rate; dyspnoea; seizures/twitches/tremors; increased vocalisation with handling; overgrown teeth; presence of tumours, neurological or musculoskeletal abnormalities. Is metabolism impaired, for example, increased or decreased food or water intake, excessive urination? Consistency of faeces.
Relative size	Any unusual changes in size of the animals should be noted, and comparisons made within the litter. It may be helpful to generate a growth curve for the line.
Numbers	Where death occurs, it is important to maintain accurate records such that any pre- or post-weaning losses can be investigated. Where appropriate (e.g. higher than anticipated mortality rate), post mortem examinations should be carried out to help determine the cause of death. A review of fertility can also be helpful in assessment of whether or not the modification is having an effect e.g. conception rates; abortions; stillbirths.

Guidelines on severity assessment and classification of genetically altered mouse and rat lines

Anne Zintzsch[1,2], Elena Noe[1,3], Monika Reißmann[1,4], Kristina Ullmann[1,3], Stephanie Krämer[1,2,5], Boris Jerchow[1,6], Reinhart Kluge[1,5], Claudia Gösele[1,2], Hannah Nickles[1,3], Astrid Puppe[1,7] and Thomas Rülicke[8]

Abstract

Genetic alterations can unpredictably compromise the wellbeing of animals. Thus, more or less harmful phenotypes might appear in the animals used in research projects even when they are not subjected to experimental treatments. The severity classification of suffering has become an important issue since the implementation of Directive 2010/63/EU on the protection of animals used for scientific purposes. Accordingly, the breeding and maintenance of genetically altered (GA) animals which are likely to develop a harmful phenotype has to be authorized. However, a determination of the degree of severity is rather challenging due to the large variety of phenotypes. Here, the Working Group of Berlin Animal Welfare Officers (WG Berlin AWO) provides field-tested guidelines on severity assessment and classification of GA rodents. With a focus on basic welfare assessment and severity classification we provide a list of symptoms that have been classified as non-harmful, mild, moderate or severe burdens. Corresponding monitoring and refinement strategies as well as specific housing requirements have been compiled and are strongly recommended to improve hitherto applied breeding procedures and conditions. The document serves as a guide to determine the degree of severity for an observed phenotype. The aim is to support scientists, animal care takers, animal welfare bodies and competent authorities with this task, and thereby make an important contribution to a European harmonization of severity assessments for the continually increasing number of GA rodents.

Keywords

animal welfare, genetically altered animals, harmful phenotype, severity assessment, severity classification

Date received: 27 February 2017; accepted: 6 June 2017

CRITERIA	WHAT TO LOOK FOR
Overall Appearance	Is the animal morphologically 'normal'? Are there any malformations or any other indicators that the phenotype has been affected? For example skeletal deformity or hydrocephalus.
Size, conformation and growth	Are there any deviations from expected size or growth curve?
Coat condition	Is there any piloerection, areas of fur loss, loss of whiskers, barbering? Is the skin / fur in good condition?
Behaviour – **Posture, gait, activity and interactions with the environment**	Do they exhibit the full repertoire of behaviours appropriate for the strain/species, including social interactions, grooming, walking, running, digging, climbing? Are these normal? Is the animal hunched or reluctant to move? Is movement impaired or is there any difficulty with orientation? Any signs of rigidity or tremors? Any abnormal activity levels? Prolonged inactivity could indicate chronic stress or depression (anhedonia) and/or sickness/pain, particularly if linked with a hunched posture and/or rough or unkempt coat. Unusual activity, such as hyperactivity, could indicate stereotypy or other behavioural abnormality.
Clinical signs	For example - nasal or ocular discharge, swollen or closed eyes; increased respiratory rate; dyspnoea; seizures/twitches/tremors; increased vocalisation with handling; overgrown teeth; presence of tumours, neurological or musculoskeletal abnormalities. Is metabolism impaired, for example, increased or decreased food or water intake, excessive urination? Consistency of faeces.
Relative size	Any unusual changes in size of the animals should be noted, and comparisons made within the litter. It may be helpful to generate a growth curve for the line.
Numbers	Where death occurs, it is important to maintain accurate records such that any pre- or post-weaning losses can be investigated. Where appropriate (e.g. higher than anticipated mortality rate), post mortem examinations should be carried out to help determine the cause of death. A review of fertility can also be helpful in assessment of whether or not the modification is having an effect e.g. conception rates; abortions; stillbirths.

Additional considerations for assessment in Neonatal animals

CRITERIA	WHAT TO LOOK FOR
Colour of pups (for neonate only)	Do any pups show evidence of abnormal skin colour (e.g. anaemia, poor circulation)
Activity of pups (for neonate only)	Any abnormal activity, e.g. reduced wriggling? Righting reflex intact?
Milk spot (for neonate only)	Do any pups fail to show presence of a milk spot? Any evidence of mis-mothering?
Litter	Litter sizes; litter homogeneity; development and growth of pups

WELFARE ASSESSMENT

Animali Neonati

Additional considerations for assessment in Neonatal animals

BASIC WELFARE ASSESSMENT OF NEW LINES

- Breeding of lines with a potential harmful phenotype
- Harmful phenotype: equivalent or higher than that caused by the introduction of a needle with good veterinary practice
- Generation of a new line → until the line is established: minimum of 2 generations
- 7 M & 7 F
- Neonates, at weaning, adult every 2/3 months → line-specific
- Develop line-specific Score Sheets for basic welfare assessment

Table 1. Major categories of systemic and behavioural disorders and diseases.

Disease model discovery from 3,328 gene knockouts by The International Mouse Phenotyping Consortium

Meehan et al. Nature Genetics 26 June 2017

The pipeline measures a total of 509 phenotyping parameters that encompass diverse biological and disease areas including neurological, behavioral, metabolic, cardiovascular, pulmonary, reproductive, respiratory, sensory, musculoskeletal and immunological parameters. Standardized protocols developed by the IMPC and automated statistical analysis are used to decrease phenotypic variance across the centers.

Identified new mouse models for human mendelian disorders with a known genetic basis

Uncovered candidate disease-associated genes for human mendelian rare disease by phenotypic similarities with OMIM and Orphanet database

Identified new mouse disease models involving genes with little or no previous functional annotation.

IMPC adheres to the ARRIVE guidelines for reproducibility of animal-model experiments, including making all data publicly available.
